

Carbalancer

Internal combustion engines use a mixture of air and fuel to generate their power. The performance therefore is influenced by the air flowing into it and the petrol that is metered out by the carburettor. Unless the air flow in multiple carburettors is accurately matched, correct running is unlikely to be achieved. Suitable for use on SU, Solex, Auto-Lite (Fomoco) Stromberg, Weber and Zenith carburettors and will fit most designs including side-draught and down-draught with air intake diameters (venturis) from 25mm to 57mm (1"-2 1/4") diameter.

Additional Information

- Easy to read scale indicates the air flow and allows adjustment to optimum efficiency.
- Provides smoother and better acceleration.
- Carbalancer can be adjusted to fit most carburettors.
- Easy to follow instructions.
